## 1. Overview

---

### 1.1. Intel Automotive-Grade Devices

Intel automotive-grade devices are certified to AEC-Q100 (Grade 2 level) and are available in CPLD, FPGA, system on a chip (SoC), and Intel® Enpirion® PowerSoCs. You can use these devices in high-temperature environments, such as in automotive sectors.

### 1.2. Intel Automotive Qualifications

The automotive grade devices are designed and developed per a quality management system (QMS) that is registered to ISO 9001:2015. The scope of the ISO 9001:2015 registration includes design, development, and provision of semiconductor components, intellectual properties, and software tools. All the foundry, assembly, and test sites that manufacture the automotive devices are operating a QMS that is registered to IATF 16949 in addition to ISO 9001:2015.

Some Intel devices comply with the following Functional Safety (FuSa) standards:

- ISO 26262
- IEC 61508

For more information about FuSa, contact your Intel sales representative.

Intel provides certified Automotive Functional Safety Data Package (AFSDP) for devices that comply with ISO 26262. AFSDP delivers the framework, methodology, tools, and IP to assist you in building a safe system with cost and time savings. AFSDP typically saves you 12-18 man-months in certifying your safety critical applications at system level.

AFSDP includes:

- Support for some Intel FPGAs (automotive-grade Cyclone® V, Cyclone V SoC, and Intel MAX® 10)
- Support for the Intel Quartus® Prime software version 14.1 and the Intel Quartus Prime Standard Edition software version 17.0.2
- FMEDA tool
- Diagnostic and standard intellectual property (IP)
- Safety manual
- Certificate

### 1.3. Supported Device Families

**Table 1. Intel Automotive-Grade Device Families**

Category	Product Family	Quartus Software Support <sup>(1)</sup>	Description
IC, FPGA	Intel Cyclone 10 LP	Version 17.1 and later	Low-cost, low-power, feature-rich FPGAs
IC, FPGA	Intel MAX 10	Version 15.1.2 and later	Low-cost, instant-on, small form factor programmable logic device, integrated analog module
IC, SoC	Cyclone V SoC	Version 12.1 and later	Low-cost, low-power, user-customizable ARM-based SoC devices
IC, FPGA	Cyclone V	Version 11.1 and later	Low-cost, low-power, feature-rich 28 nm FPGAs
IC, FPGA	Cyclone IV	Version 9.1 SP2 and later	Low-cost, low-power, feature-rich 60 nm FPGAs (1.2 V)
IC, CPLD	MAX V	Version 11.0 and later	High-density, low-power glue logic CPLDs (1.8 V)
IC, CPLD	MAX II	Version 7.2 SP1 and later	High-density, low-power glue logic CPLDs (3.3 V, 2.5 V)
IC, power	Intel Enpirion	—	Integrated inductor, combination of small footprint, low noise performance, and high efficiency

Volume Production Support for Legacy Device Families			
Category	Product Family	Quartus Software Support <sup>(2)</sup>	Description
IC, FPGA	Cyclone III	Version 8.0 to 13.1	Low-cost, feature-rich 65 nm FPGAs
IC, FPGA	Cyclone II	Version 7.2 SP1 to 13.0	Low-cost, feature-rich 90 nm FPGAs
IC, FPGA	Cyclone	Version 7.2 SP1 to 13.0	Low-cost, glue logic 130 nm FPGAs
IC, CPLD	MAX 7000AE	Version 7.2 SP1 to 13.0	High-performance, glue logic CPLDs (5-V I/O compatible)

(1) Starting from version 15.1, the Quartus II software is known as the Intel Quartus Prime Standard Edition software.

(2) The legacy devices are only supported in the Quartus II software.

## 2. Supported Automotive-Grade Devices

### 2.1. Intel Cyclone 10 LP Devices

#### 2.1.1. Supported Automotive-Grade Devices

**Table 2. Automotive-Grade in Intel Cyclone 10 LP Devices**

Other automotive-grade product line/package combinations or ordering codes might be available upon request. Consult your Intel sales representative to submit your request.

Device Ordering Code	Device	Package	Junction Temperature Range	Speed Grade
10CL006YE144A7G	10CL006	144-pin EQFP	-40°C to 125°C	-7
10CL006YU256A7G	10CL006	256-pin UBGA	-40°C to 125°C	-7
10CL010YE144A7G	10CL010	144-pin EQFP	-40°C to 125°C	-7
10CL010YM164A7G	10CL010	164-pin MBGA	-40°C to 125°C	-7

## 2.12.2. Device Ordering Codes

Figure 14. Automotive-Grade Ordering Information for MAX 7000A Devices

### 3. Intel Quartus Prime Software Support

---

The Intel Quartus Prime design software supports the automotive-grade devices in the automotive temperature range. The Intel Quartus Prime software provides a comprehensive environment for SoC design. It also includes HDL and schematic design entry, compilation and logic synthesis, full simulation and advanced timing analysis, Signal Tap II logic analyzer, and device configuration.

To target an automotive-grade device in your design in the Intel Quartus Prime software, follow these steps:

1. Click **Assignments** ► **Device**. The **Settings** dialog box appears.
2. In the **Family** drop-down list, select your device.
3. Under **Target device**, select **Specific device selected in 'Available devices' list**.
4. In the **Available devices** list, select the appropriate ordering code.

*Note:* The Intel Quartus Prime software does not show the "N" suffix, which indicates a lead-free device. For example, the 5CGXFC3B6U15A7N device is shown only as 5CGXFC3B6U15A7.

5. Click **OK**.

The following automotive-grade devices are from the legacy device families and are not recommended for new automotive designs.

- Cyclone III
- Cyclone II
- Cyclone
- MAX 7000AE

## 4. Power Analysis and Estimation

---

### 4.1. Early Power Estimator

The Early Power Estimator (EPE) is a power estimation tool that helps you estimate the power consumption of your design during the system planning phase for proper power supply planning and consideration.

The EPE allows you to enter design information based on architectural features and calculates the power consumed by each architectural feature. Inputs to the EPE are environmental conditions and device resources (such as clock frequency, RAM blocks, and digital signal processing [DSP] blocks) that you expect to use in your design. The EPE then calculates the static and dynamic power, current estimates, and thermal analysis for the design.

You can either enter the design information manually into the spreadsheet or import a power estimator file of a fully or partially completed design from the Intel Quartus Prime software. After importing a file, you can edit some of the input parameters including  $V_{CCINT}$ , ambient temperature, airflow, clock frequency, and toggle percentage to suit your system requirements.

The value obtained from the EPE is only an estimation and should not be used as a specification. The accuracy of the EPE results depends on how close your input of the design information into the EPE resembles that of the final design.

For more information about the EPE, and how to generate and import the power estimator file, refer to the respective user guides.

#### Related Information

[Early Power Estimators \(EPE\) and Power Analyzer, Intel page](#)

Provides the EPE and user guides.

### 4.2. Power Analyzer

The Power Analyzer tool in the Intel Quartus Prime software is a power analysis tool that helps you calculate your design power consumption accurately to ensure thermal and power supply budgets are not violated after your design is complete. The Power Analyzer tool requires your design to be synthesized and fitted to the target device. Availability of information such as design resources, how the design is placed and routed on the target device, and the I/O standards assigned to each I/O cell allow the Power Analyzer tool to provide accurate power estimation.

The process of using the Power Analyzer tool consists of the following three parts:

- Specifying sources of input data
- Specifying operating conditions
- Running the Power Analyzer tool

The input data consists of the signal activities data (toggle rates and static probabilities) of the compiled design. Signal activity data can be derived from simulation results, user assignment in the Assignment Editor, user-defined default toggle rate, and vectorless estimation.

The operating conditions include device power characteristic, ambient and junction temperature, cooling solution, and board thermal model, all of which can be set in the Intel Quartus Prime software.

The Power Analyzer tool calculates the dynamic, static and I/O thermal power consumption, current consumed from voltage source, a summary of the signal activities used for analysis, and a confidence metric that reflects the overall quality of the data sources for the signal activities.

#### **Related Information**

## 5. DC and Timing Specifications

---

The automotive-grade devices have the same values for the following specifications as published in the respective device datasheets :

- Absolute maximum ratings
- Recommended operating conditions
- DC electrical characteristics
- Timing specifications over the automotive temperature range

For the maximum power-up current ( $I_{CCINT}$ ) required to power up an automotive-grade Cyclone device, use the value specified for the corresponding industrial-grade device.

The on-chip series termination ( $R_S$  OCT) specifications for the following automotive-grade devices are as follows:

- Automotive-grade Cyclone III, Cyclone IV, Cyclone V, Cyclone V SoC, Intel Cyclone 10 LP, and Intel MAX 10 devices—same as the corresponding industrial-grade devices
- Automotive-grade Cyclone II devices—same as the corresponding extended-temperature devices

The switching characteristics of the automotive-grade Cyclone III, Cyclone IV, Cyclone V, and Cyclone V SoC devices are the same as the devices with -8 speed grade as published in the respective device datasheets.
